## Chemguide - questions

## THE IONIC PRODUCT FOR WATER, $K_{w}$

1. a) Write the expression for $\mathrm{K}_{\mathrm{W}}$.
b) What are the units for $\mathrm{K}_{\mathrm{w}}$ ?
c) At a temperature a tiny fraction of a degree less than $25^{\circ} \mathrm{C}$, the value for $\mathrm{K}_{\mathrm{w}}$ is $1.00 \times 10^{-14}$ (in the units you will have quoted in your last answer). Use this information to show why the pH of pure water is 7 at this temperature.
d) At $30^{\circ} \mathrm{C}, \mathrm{K}_{\mathrm{W}}$ has a value of $1.471 \times 10^{-14}$ (in the same units). Calculate the pH of pure water at this temperature. Is the water now acidic, alkaline, or still neutral? Explain your answer.
e) As the temperature increases, the value of $\mathrm{K}_{\mathrm{W}}$ increases. Use your knowledge of Le Chatelier's Principle to work out whether the ionisation of water is exothermic or endothermic:

$$
2 \mathrm{H}_{2} \mathrm{O}_{(l)} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}(a q)+\mathrm{OH}_{[(\mathrm{aq})}^{-}
$$

2. a) Define $\mathrm{pK}_{\mathrm{w}}$.
b) What is the value of $\mathrm{p} \mathrm{K}_{\mathrm{w}}$ at $30^{\circ} \mathrm{C}$ ? (Use the $\mathrm{K}_{\mathrm{w}}$ value from $\mathrm{Q} 1(\mathrm{~d})$.)
